TITLE:

Mechanization and Automation in the Packaging of

Food Concentrates

PERIODICAL:

Mekhanizatsiya i avtomatizatsiya proizvodstva, 1959,

Nr 4, pp 17-21 (USSR)

ABSTRACT:

At the Leningradskiy kombinat pishchevykh kontsentratov (Leningrad Food Concentrate Combine), 95% of the total production is turned out in parcels. At present, the Leningrad Combine uses 22 wrapping and packing machines of various brand, type and design. The Soviet made APB machine, produced by the Voronezh-skiy mashinostroitel nyy zavod imeni V.I. Lenina (Voronezh Machine-Building Plant imeni V.I. Lenin), is used for packing loose and powdery products (coffee, special flour for children and diet, dried breadcrumbs, etc.). The "APD" is used for packing flaky products (corn, wheat and "Gerkules" oat flakes). By using the APB machine, labor productivity has been

SOV/118-59-4-5/25

Mechanization and Automation in the Packaging of Food Concentrates

raised 14 times; using the APD, labor productivity has been increased 5.5 times. Both machines are obsolete and need modernization. There is a marked difference between the a/m and, e.g., the "Khanzella" machine for packing granular and powdery products in transparent cellophane wrappings (productivity - 60 parcels parent certophane wrappings (productivity - ou parcets per minute). UZA and UEA machines are used for packing and wrapping food concentrates (soups, porridge, jellies, etc.). Both machines are produced by the Leningradskiy mashinostroitel'nyy zavod "Krasnaya vagranka" (the Leningrad Machine Building Plant "Krasnaya Vagranka"). Ouglity and productivity is now naya Vagranka"). Quality and productivity is poor compared with the "Nagema" and "Shokopak" machines (both produced in the Soviet Zone of Germany). The author expresses his astonishment that new series of the outmoded UZA and UEA machines have been ordered again and objects to the blind copying of obsolete

Manufacture of electrowelded shaped pipes at Plant im. Lenin

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 4, 1962, 38, abstract 4D221 (V sb. "Proiz-vo trub". Khar'kov, Metallurgizdat, no. 4, 1961, 72-78)

The experiments on the manufacture of electrowelded shaped pipes at the Plant im. Lenin provided for their profiling directly on the electric pipe TEXT: welding unit whose sizing mill consists of 3 horizontal driven stands, 3 vertical non-driven stands and a dressing head. At the normal operation of the unit the pipes, on leaving the sizing mill, have a certain curvature; however, the profiling and dressing of pipes proved impossible in the dressing head rolls at the same time. The experiments on profiling pipes with a simultaneous dressing by the usual method (by changing the relative position of cassettes of the dressing head) resulted in angles of different curvature in pipes, that is, in a distortion of their profile. Also the conveyance of pipes beyond the sizing mill limits was difficult, since the dressing head rolls are non-driven ones. For this reason the strip reels were butted by means of autogenous welding which led to

Manufacture of electrowelded ...

an increased metal consumption (cutting out non-fusions and butts) and to a lower efficiency of the mill owing to stops. The use of the third stand of the sizing mill made possible to cut considerably the load on the dressing head rolls. The dressing of pipes caused no special difficulties. However, also this technological version did not eliminate the difficulties with the conveyance of pipes beyond the sizing mill limits. The most effective method of producing electrowelded shaped pipes is their production directly on the electric pipe welding unit by means of four-high stands of the sizing mill and also the application of a reliable and speedy method of cutting pipes running. The following sizes of electrowelded shaped pipes are introduced: 80 x 60 x 4.0, 60 x 60 x 4.0 and

TOPIC TAGS: welding mannino, generator, steel, radio frequency welding, and the property /
51-152 welding mannino, generator, 20 steel, 1Kh18N9T steel, 2 steel

ABSTRACT: Electric pipe welding machine 51-152 at the Dnepropetrovsk Pipe Factory im. V. I. Lenin (Dnepropetrovskiy truboprokatnyy zavod) was modified, and tests of radio frequency welding of medium diameter pipes were performed. The machine was equipped with a tube-type generator LZ-207 which generated 200 kw at 74 kc. Pipes 89 x 2.5 mm and 89 x 3.5 mm (made of steels 20 and 2) and 76 x 2.5-mm pipes of steels 20 and lKal8N9T were welded. Although the quality of the welds was superior, the yield was poor and numerous problems with the equipment were encountered. In October 1962 similar tests were performed on 140 x 4.5-mm pipes of steel 2, using 350 kc (there was insufficient time to raise the frequency to the planned 440 kc). The maximum rate reached 27.5 m/min (intermittent), and again repeated equipment failures were encountered. To make this

TITLE:

On prolonged service life of electric pipe-welding machine rolls

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 29, abstract 2D153 (V sb. "Proiz-vo trub", no. 5, Khar'kov, Metallurgizdat, 1961,

118 - 125)

At the Plant imeni Lenin experiments were carried out to determine TEXT; maximum permissible wear of the rolls of an electric pipe-welding machine in the production of basic assortment pipes. A method is suggested for calculating the dimensions of rolls of the shaping and grooving stands in regrinding; the method makes it possible, by measuring the maximum wear of rolls, to determine the magnitudes of optimum approach of semi-rolls and of the roll diameter after regrinding. Calculation of the magnitude of the semi-rolls approach by the formula derived yields an optimum magnitude of this value which is required to assure minimum reduction of the diameter of rolls to be recovered. Reconditioning of the shaping and grooving stand rolls, which is based on the calculation of their dimensions

AUTHOR: Vol'pert, A. I.

TITLE: Normal solvability of boundary value problems for elliptic systems of differential equations on the plane

CITED SOURCE: Sb. Teor. i prikl. matem. Vy*p. 1. L'vov, L'vovsk. un-t, 1958,

TOPIC TAGS: normal solvability, boundary value problem, differential equation elliptic system, canonical form reduction, non-singular linear transformations, matrix, Cauchy problem, singular Cauchy integral equation

TRANSLATION: For the elliptic system:

$$Lu - A(z) \frac{\partial u}{\partial x} - \frac{\partial u}{\partial y} + B(z) u +$$

$$+ \iint_{\mathbb{R}} R(z, \zeta) u(\zeta) d\zeta d\eta - f(z),$$

Cord 1/3

-11

ACCESSION NR: AR4039291

where z=x+iy, $\zeta = \xi$ + in, A, B, R are square matrices of order 2r, the author considers the following problems:

1. The reduction of the elliptic system (1) to canonical form, and particularly, by means of a non-singular linear transformation, the matrix A is reduced to the

$$A(z) = \begin{pmatrix} A^{(1)}_{(2)}(z) - A^{(2)}_{(1)}(z) \\ A^{(2)}_{(2)}(z) + A^{(1)}_{(2)}(z) \end{pmatrix},$$

and the r-order matrix $A^{(1)}(z) + iA^{(2)}(z)$ does not have real eigen values.

2. The Cauchy problem for the system conjugate to (1). A necessary and sufficient condition for its solvability is derived.

3. The boundary value problem with boundary condition of the form

$$\Lambda u = a(t)u(t) + \int b(t,t_1)u(t_1)ds_1 = f(t).$$

MTMT D

TITLE: On the index of a system of two-dimensional singular integral equations

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 4, 1962, 776 - 777

TEXT: The system of singular integral equations

 $a(x)u(x) + \int_{S} b(x, y-x)u(y)d_{y}S + Tu = f(x)$ (1)

is considered. The difference $\mathscr{X}=k-k^*$ between the dimension numbers k and k^* of the solution spaces of the homogeneous system (1) and its adjoint system is said to be the index of the system (1). The condition of solvability of the system (1) reads det $\Phi(\mathcal{T})\neq 0$ ($\mathcal{T}\in P$), where Φ is a certain matrix of the order p and where P is the set of all tangential unit vectors of the surface S which is assumed to be homeomorphic to the sphere. The vector $\Psi(\mathcal{T})=\rho(\mathcal{T})/|\rho(\mathcal{T})|$, where $\varphi(\mathcal{T})$ is one of the columns of $\Phi(\mathcal{T})$ maps the set P into the unit sphere. It is demonstrated that the degree Card 1/2

TITLE:

On the index and normal solubility of the boundary-value problems for an elliptic system of differential

equations in a plane

SOURCE:

Moskovskoye matematicheskoye obshchestvo. Trudy.

v. 10, 1961, 40 - 87

TEXT: The author states that the work will be devoted to two problems. The first is the problem of the index which he defines as the difference between the dimensionality of the subspace of solutions for the corresponding homogeneous problem and the number of independent conditions of solubility of the given case. The second problem is that of the algebraic expression of the Neter boundary-value problems of a general algebraic system of equations with two independent variables. Some auxiliary assumptions on the expansion of operators, defective numbers and the index of linear operators, and the solubility of systems of singular integral equations exact

where $f \in H_D$, $g \in H_\Gamma$ are given column vectors, a, a_0 , p are real square matrices of order 2r, b and q are r x 2r matrices, z = (x, y), $S = (S, \eta)$. The corresponding problem \tilde{I} of systems of special form is also considered, in which the matrix $\tilde{a}(z)$ (corresponding a(z) in problem I) is of the form

 $\mathfrak{A}(z) = \begin{pmatrix} a_1(z) - a_2(z) \\ a_2(z) & a_1(z) \end{pmatrix}$ (2.8)

where $a_1(z)$ and $a_2(z)$ are square matrices of order r so that for all proper values of λ the matrix $a_1(z) + ia_2(z)$ lies in the upper λ -half-plane. [Abstractor's note: $a_1(z) + ia_2(r)$ in the text]. By means of the author's earlier work (Ref. 24: Teor. i prikl. matem., no. 1/1958/, 28-57), the index κ of problem I is given by $\kappa = 2I_{\Lambda}(b) + r$

where b is the matrix of (2.2) and $I_A(b)$ an operator defined in the Card 3/7

TITLE:

AUTHOR:

On reducing boundary value problems of elliptical systems of higher order equations to problems of

first order systems

PERIODICAL:

Akademiya nauk Ukrayins koyi RSR. Dopovidi, no. 9,

1960, 1162 - 1166

TEXT: The author shows how to reduce boundary problems I and II for higher order elliptical equations to corresponding problems of the first order.

Lu = $\sum_{0 \leq k+1 \leq n} A_{k1}(z) \frac{\partial^{k+1} u}{\partial x^k \partial y^1} (z = (x, y))$ (1)

is an elliptical differential operator where $A_{kl}(z)$ are real square matrices of order p, determined in some region G; they satisfy con-

Oard 1/5

On reducing boundary value ...

。 "一个人,你不是一个人,你就是我们的一个人,你就是一个人,你就是一个人,你就是我们就是我们的一个人,你就是我们的一个人,你就是我们的一个人,你就是我们的一个人

ditions H for k+l < n and have continuous derivatives in Helder's sense, for k+l = n. D is a finite simply connected region, bounded by a smooth curve Γ ; $\overline{D} = D + \Gamma$ (G

where $a_{kl}(z)$ are matrices of order $np/2 \times p$, determined and continuous in Helder's sense on Γ . Problem I. To find a solution $u \in K_{n,p}$ of the system Lu = f which satisfies a boundary condition $\Lambda u = 0$. Problem II. To find a solution $u \in K_{n,p}$ of the system Lu = 0 which satisfies a boundary condition $\Lambda u = g$. $K_{n,p}$ means a linear space of functional columns which have n-th continuous derivatives in D and (n-1)-st continuous derivatives in D; f and g are given functional columns, satisfying condition H in D and on Γ respectively. The author introduces the additional condition

Card 2/5

On reducing boundary value ...

$$[\psi_j, u] = 0 \ (j = 1, 2, ..., m, m = \frac{n(n-1)}{2} p).$$
 (3)

By substitution

$$\frac{\partial^{n-1} u}{\partial x^{n-1} \partial y^{n-k}} = v_k \quad (k = 1, \ldots, n), \quad v = \begin{pmatrix} v_1 \\ \vdots \\ v_n \end{pmatrix}, \quad (4)$$

and equality $U(z) = \iint_D Q(z, \xi)v(\xi)d\xi d\eta (\xi = (\xi, \eta))$ (5)

the problems I and II. were reduced to the two following problems: Problem III. To find a solution $v \in K_{1,pn}$ of a system of equations

$$L_{\underline{1}}v \equiv a(z) \frac{\partial v}{\partial x} - \frac{\partial v}{\partial y} + a_{\underline{0}}(z)v + \iint_{\underline{D}} p(z, \zeta)v(\zeta)d\xi d\eta = f_{\underline{1}}$$
(6)

which satisfies a boundary condition Card 3/5

On reducing boundary value ...

$$\Lambda_{1}v \equiv b(z)v + \iint\limits_{D} q(z, \zeta)v(\zeta)d\hat{\xi} d\eta = 0.$$

Problem IV. To find a solution $v \in K_1$, pn of a system $L_1v = 0$ which satisfies a boundary condition $\Lambda_1v = g$. Here

$$a = \begin{pmatrix} A_{1}, n-1 & A_{2}, n-2 & \dots & A_{n-1}, & A_{n}, \\ E & 0 & \dots & 0 & 0 \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & E & 0 \end{pmatrix}, f_{1} = \begin{pmatrix} f \\ 0 \\ \vdots \\ 0 \end{pmatrix},$$

$$b = (a_{0}, n-1, \dots, a_{n-1}, 0),$$

On the basis of this reduction, the author proves the normal solvability of higher order boundary problems. The author also proves the formula for index $\varkappa=k-1$ of problems I and II; where k is a number of independent solutions of homogeneous problem I and $l=\dim \mathcal{M}$.

Card 4/5

On reducing boundary value ...

$$\varkappa = -2 \text{ ind } A_B + \frac{pn^2}{2} + d.$$

PERIODICAL: Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 7,

1960, 873 - 877

TEXT: In this paper the author considers two conjugate problems for the elliptic system of equations of the first order. The author proves the formula for the index, i.e. the difference between the numbers of linear independent solutions for the given and conjugate problems. His present paper is a continuation of the previous. work (Ref. 2: DAS USSR, 114, 462, 1957) and (Ref. 4: DAS UKRSSR 590, 1960) where all notations are given which the author uses in the present paper. Problem 1): To find a solution ueK1, of the

elliptic system of equations

 $a(z)\frac{\partial u}{\partial x} - \frac{\partial u}{\partial y} + a_0(z)u + \int \int_{\Omega} p(z,\zeta) \, u(\zeta) \, d\zeta \, d\eta = f(z), \tag{3}$

Card 1/4

On applying one topological ...

which satisfies the boundary condition $B(z)u|_{\Gamma}=0$ (4). Here z=(x,y), $S=(S,\eta)$, a(z)-a real quadratic matrix of 2r order, with the first derivatives in Helder's sense, continuous in some domain $G \supset \overline{D}$, B(z)-a given real matrix $r \times 2r$, f-a functional column continuous in Helder's sense in \overline{D} , D a simply-connected region and Γ - Lyapunov's curve. Let

 $A(z) = \int [a(z) - \lambda E]^{-1} d\lambda, \qquad (5)$

where γ - a contour in a half plane $\operatorname{Im} \lambda > 0$, which contains all the roots of a polynomial. Let $[a(z) - \lambda E]$ which lie in this plane. It is assumed that the additional condition R is fulfilled: The rank of matrix B(z) A(z) is equal to r, for all $z \in \Gamma$. Problem 1*) is to find a solution veK_1 of the system of equations

$$-\frac{\partial a'(z)v}{\partial x} + \frac{\partial v}{\partial y} + a'_{0}(z)v + \int \int_{D} \rho'(\zeta,z)v(\xi) d\xi d\eta = g(z).$$

Card 2/4

On applying one topological ...

which satisfies a boundary condition $B_*(z)$ $\sigma^*(z)v|_{\Gamma}=0$, where $\sigma(z)=a(z)\cos{(\P,x)}-\cos{(\Psi,y)}E$, where ν is normal to Γ at point z. Theorem. If condition R for Problem 1 is satisfied, then condition R for the Problem 1* is fulfilled as well. Three additional theorems could be proved: 1) Subspaces U and V for the solutions of homogeneous Problems 1 and 1* (f=0, g=0) have finite dimensions. 2) The necessary and sufficient condition that the problem 1* has a solution, is that the right hand side f is orthogonal to all $v \in V$, i.e.

 $\iint_{\mathbb{D}} v' f dx dy = O(v \in V).$

3) Index ($\kappa = \dim U - \dim V$) for Problem 1 is calculated by $\kappa = -2 \text{ ind } A_B + r. \tag{6}$

Next, the author gives a generalization for the systems which are not of the canonical type. Let L be an operator determined by the left-hand side of Eq. (3), D_{T_i} - a region, where it is determined

Card 3/4

28679 \$/021/60/000/007/002/009

D211/D305

On applying one topolomical ...

 $\Lambda u = B(z)u(z) + \iint_{\Sigma} q(z, \zeta)u(\zeta) d\xi d\eta(z \in \Gamma)$

where $L_o(\Lambda_o)$ is a part of operator $L(\Lambda)$, determined on the subspace of zeros of operator Λ(L) [Abstractor's note: It should bably be $L(\Lambda)$], then the necessary and sufficient conditions that the system of equations $L_0 u = f$; $u \in D_{L_0}$, $f \in \mathbb{R}_1$ - has a solution, is that

$$\iint_{\mathbf{D}} \mu_{\mathbf{A}} f dx dy = 0, j = 1, \dots, \beta_{\mathbf{L}_{0}} \left(\int_{\mathbf{T}} \gamma_{\mathbf{j}} g ds = 0, j = 1, \dots, \beta_{\mathbf{A}_{0}} \right).$$

TITLE:

On the First Boundary Value Problem for Elliptic Systems of

Differential Equations

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 3, pp 487-489 (USSR)

ABSTRACT:

In the finite, simply connected domain D with the n-fold smooth boundary the author considers the boundary value problem

$$\frac{\partial^k u}{\partial y^k}\Big|_{\Gamma} = 0 \quad (k = 0, 1, ..., m)$$

for the elliptic system

$$\sum_{0 \le k+1 \le n} A_{k1}(z) \frac{\partial^{k+1} u}{\partial x^k \partial y^1} = f(z) \qquad (z = (y,y))$$

 A_{kl} (z) are quadratic matrices of order p; in 0 + Γ they have continuous derivatives in the sense of Hölder of order k + 1; f is the given column and u the sought column; ∂/∂ y denotes the derivative with respect to the normal to Γ ; n is the

Card 1/3

On the First Boundary Value Problem for Elliptic Systems of Differential Equations

507/20-127-7-1/74

number of pairs; $m=\frac{1}{2}n-1$. The solution is sought in the class of functions with a continuous derivatives in D and (n-1) continuous derivatives in D + Γ . It is supposed that for all $z \in \Gamma$ it holds :

$$\det \int_{-\infty}^{\infty} Q!(\lambda) X^{-1}(z,\lambda) Q(\lambda) d\lambda \neq 0,$$

where
$$X(z, \lambda) = \sum_{k+1=n}^{A_{k1}(z)} \lambda^{1}$$
; $Q(\lambda) = (E, E\lambda, ..., E\lambda^{n})$,

E unit matrix of order p; Q' transposed to Q. For the problem formulated above the author gives an explicit formula for the determination of the index. The formula is obtained with the aid of a triangulation of D and generalizes the formula abtained by the author in / Ref 4 / for the index of the Dirichlet problem for n = 2 to the multidimensional case.

TITLE:

Boundary Value Problems for Elliptic Systems of Differential

Equations of Higher Order on a Plane

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 127, Nr 4, pp 739-741 (USSR)

ABSTRACT: In the finite domain D bounded by T the problem

(1)
$$\sum_{0 \leq k+1 \leq n} \mathbf{A}_{kl} \frac{\mathbf{j}^{k+l_u}}{\mathbf{j}_x^k \mathbf{j}_y^l} = \mathbf{f} ,$$

(2)
$$\Lambda_{j^{u}} = \sum_{0 \leq k+1 \leq m_{j}} a_{k1}^{(j)} = \frac{3^{k+1}u}{3^{k}3^{y^{1}}} = 0 \quad (j=1,\ldots,\frac{pn}{2})$$

is considered. Under numerous conditions (among them those of Ya.B.Lopatinskiy / Ref 5 / it is shown that the homogeneous problem (f 0) has finitely many (k) linearly independent solutions. For the solvability of the inhomogeneous problem it

is necessary and sufficient that $\iint v_j^t f dx dy = 0$, where v_j is a

Card 1/2

Boundary Value Problems for Elliptic Systems SOV/20-127-4-2/00 of Differential Equations of Higher Order on a Plane

pertain function. It is proved that there exist finitely many (1) linearly independent columns with this property. For the index of the problem of m k-1 an explicit expression is given which bases on the results of [Ref 6]. The author investigates the dependence of the index W on the index W of the first boundary

value problem for (1). He mentions I.N. Vekua. There are 6 Soviet references.

TITLE

The Investigations of the Boundary Problems for Elliptical Systems of Differential Equations in a Plane (Issledovaniye granichnykh zadach dlya ellipticheskikh sistem differentsialnykh uravneniy na ploskosti)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1957, Vol# 114, Nr 3, pp=462-464 (USSR)

ABSTRACT:

The present paper investigates boundary problems for elliptical systems of equations of the first order. Also the boundary problem given in the following is reduced in an equivalent manner (in the sense given below). - Problem Nr 1 - The Solution U(z) of the class K of the elliptical system

tion U(z) of the class K of the elliptical system $\sum_{k+\ell \leq n} A_{k\ell}(z) \frac{\partial^{k+2}U}{\partial x^k \partial y^{\ell}} = F(z) \qquad (z=x+iy \in D),$

is sought, which satisfies the boundary condition

Card 1/3

 $\sum_{k+\ell \leqslant n-1} \left[a_{k\ell}(t) \ U_{k\ell}^{+}(t) + \int b_{k\ell}(t,t_1) \ U_{k\ell}^{+}(t_1) ds_1 \right] = f(t)$

20-114-3-3/60

The Investigations of the Boundary Problems for Elliptical Systems of Differential Equations in a Plane

(ter). Here $A_{k,\ell}(z)$ denotes the real, quadratic matrices of the order p in a certain domain D. By making use of a certain substitution given here problem Nr 1 is reduced to the following problem Nr 2.—

A column having a height 2r = np is to be found as well as a constant column c with the height r(n-1); which satisfies the system of equations.—

Lu = $A(z) \frac{\partial u}{\partial x} - \frac{\partial u}{\partial y} + B(z)u + \iint_{\mathbb{R}} R(z,\xi)u(\xi)d\xi d\eta = F(z) + M(z)c$

and the boundary condition $\Delta u = a(t)u(t) + b(t,t_1)u(t_1)ds_1 = f(t)+N(t)c$ (with $(t \in T)$).

Here is true that $z = x + iy \in D$, $\xi = \xi + i\eta$. The author investigates the problem Nr 2 by the method developed by I. N. Vekua. Problem Nr 2 is here deduced to the form $\Delta u = 0$, $\Delta u = f$. Every solution u(z) of the system Lu=0 can be represented in the form

 $u(z) = \int_{\mathbb{R}} H(\xi, z) \mu(\xi) d\xi + \sum_{j=1}^{\infty} o_j u^{(j)}(z)$. Here $\mu(\xi)$ denotes

Card 2/3

20-114-3-3/60

The Investigations of the Boundary Problems for Elliptical Systems of Differential Equations in a Plane

a column with the height r, which satisfies Gelder's condition T and $c_1(j=1,\ldots r)$ are constants. By means of the representation mentioned the problem $\mathcal{L}u=0$, $\Lambda u=f_0$ is reduced to an equivalent system of singular integral equations with a kernel of the Cauchy type. For the solvability of the problem $Lu=F_1$, $\Lambda u=0$ it is necessary and sufficient that F be orthogonal with respect to all solutions of the adjoined homogeneous problem. There are 9 references, 9 of which are Slavic.

pp 1042 - 1044 (USSR)

The author considers a homogeneous Dirichlet problem for an ABSTRACT:

elliptic system of differential equations

 $\sum_{0 \le h+1 \le 2} A_{h}(3) \frac{\partial^{h+1} u}{\partial x^{h} \partial y} = 0$ z denotes

where z denotes a point (x,y); Akl(z) are real square matrices

of p-order given in some region D, which have derivatives with respect to x and y up to the order k + 1, continuous in a sense given by Gelider; u is a functional column composed of p elements. The ellipticity is understood in the sense attached to this word by I.G. Petrovskiy Ref. 1,27. It is assumed that Ya.B. Lopatinskiy's condition Ref. 3 has been fulfilled, which guarantees the finiteness of numbers k and k of the linear independent solutions of the problem in question and of that adjoint to it, that is given by

the following system of equations: Card 1/2

(-1) had dhall A'LLV = 0

SOV/21-58-10-3/27

On the Calculation of the Index of Dirichlet's Problem

The author derives formulae for the calculation of the index (=k - k) of Dirichlet's problem through the minors of a certain matrix R(z). An example of the system of differential equations is given, in which & may be any even number with the proper selection of the function φ . There are 4

Soviet references.

On the Index of the Dirichlet Problem

Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1960, PERIODICAL: No. 5. pp. 40 - 42

By an explicitly solvable example it is shown that the index of the Dirichlet problem for an elliptic system may be equal to an arbitrary even number.

The author considers

(1)
$$\frac{\partial x}{\partial x} \left(a \frac{\partial x}{\partial u} \right) + \frac{\partial x}{\partial x} \left(b \frac{\partial y}{\partial u} \right) + \frac{\partial y}{\partial y} \left(c \frac{\partial x}{\partial u} \right) + \frac{\partial y}{\partial y} \left(a^{\dagger} \frac{\partial y}{\partial u} \right) = 0$$

$$a = \frac{1}{\Delta} \begin{pmatrix} q & p-1 \\ p+1 & -q \end{pmatrix}; b = \frac{1}{\Delta} \begin{pmatrix} -p+1 & q \\ q & p+1 \end{pmatrix}$$

$$c = \frac{1}{\Delta} \begin{pmatrix} p+1 & -q \\ -q & -p+1 \end{pmatrix}; a! = \frac{1}{\Delta} \begin{pmatrix} q & p+1 \\ p-1 & -q \end{pmatrix}$$

86178

On the Index of the Dirichlet Problem

S/140/60/000/005/005/021 C111/C222

 $\Delta = 1 - p^2 - q^2$; p, q are polynomials : $p = \lambda \text{ Re } z^n$, $q = \lambda \text{ Im } z^n$

 $(z = x + iy, 0 < \lambda < 1)$; $u = \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}$; n is an arbitrary natural number.

(1) is elliptic in $|z| \le 1$ since

 $\det(a \alpha^2 + b \alpha \beta + c \alpha \beta + a^2 \beta^2) = \frac{1}{\Delta} (\alpha^2 + \beta^2)^2$

Let K be the class of functions continuous in $|z| \le 1$ together with their first derivatives, and having continuous second derivatives in $|z| \le 1$. Problem: Determine in D a solution of the class K of (1) which satisfies the boundary condition $u|_{\Gamma} = 0$, where Γ is the circle |z| = 1. It is shown that this problem has the index 2n. There is 1 Soviet reference.

TITLE:

Some theorems on linear operators

PERIODICAL:

6000

Akademiya nauk ukrayins'koyi RSR Dopovidi, no. 5, 1960,

590-594

TEXT: The author states and proves certain lemmas on linear operators in linear anaces, and hence proves the normal solubility of one special class of linear operators with boundary value problems for elliptic systems of differential equations. The following notation is used. R and R, are linear space, A is an operator which transforms elements of R into elements of R_1 , \mathcal{D}_A is the region of definition of A, \mathcal{P}_A is the region of values of A, \mathcal{F}_A is the subspace of zeros, i.e. the set of solutions u of the equation Au = 0 (u $\in \mathcal{D}_A$), \mathcal{C}_A and \mathcal{C}_A and \mathcal{C}_A dim (R_1/R_A) . Abstractor's Note: R_A is not defined \mathcal{F}_A . If \mathcal{C}_A and \mathcal{C}_A

Card 1/7

S/021/60/000/005/003/015 D210/D304

Some theorems...

are finite then A is finite, and \mathcal{H}_A , defined by $\mathcal{H}_A = \mathcal{H}_A - \beta_A$, is called the index of A. Further, if A and B are operators which transform elements of R into elements of R_1 and R_2 respectively, then A_0 (B₀) denotes the part of A (B) which is defined on β_B (β_A). Lemma 1: β_A and B₀ are finite if and only if β_B and A₀ are finite. In this case \mathcal{H}_A = \mathcal{H}_B + β_B (1) Lemma 2: Ψ is a linear space of linear functions over R_2 , and Φ is a linear space of linear functions defined over R_1 . Ψ_0 is the subspace of functions Ψ for thogonal to β_B . It is assumed that for each Ψ there is a corresponding Φ for such that Φ (Au) = Ψ (Bu) (3), for all u fr. Then from the normal solution of the operators B₀ and A follows the normal solution of A₀. Lemma 3: Let R_1 , R_2 , R_3 be linear spaces, and A and B linear operators which Card 2/7

Some theorems ...

S/021/60/000/005/003/015 D210/D304

transform from Ro into Ra and from Ra into Ro resign Further C = AB has a finite d-characteristic, and one of the numbers ${f d}_{f A}$ or ${f eta}_{f R}$ is finite. Then A and B have finite d-characteristics and $\mathcal{H}_{C} = \mathcal{H}_{A} + \mathcal{H}_{B}$ (6). In the case when R_{1} , R_{2} and R_{3} are Banach spaces, Eq. (6) was investigated by F.V. Atkinson (Ref. 2: Matem.sb., 28, 3 (1951)) for bounded operators and by I. Ts. Hokhberh (Ref. 3: Matemash., 33, 193(1953)). D is a finite singly-connected region, bounded by Lyapunov's -curve. The elliptic integro-differential operator is considered, where a,, a p are real square matrices of $Lu = a_1(z)\frac{\partial u}{\partial x} - \frac{\partial u}{\partial y} + a_0(z)u + \int_{-\infty}^{\infty} \int \rho(z,\varsigma) u(\varsigma) d\bar{s} d\eta,$ order 2r, u is a column vector with 2 r elements; z=x+iy, $S = \hat{S} + l\eta$. It is assumed that the matrix $a_1(z)$ has first derivatives with respect to x and y which are continuous in Helder's sense in some space $G \supset D + \Gamma$; $a_{a}(z)$ satisfies Helder's condition in G;

Card 3/7

S/021/60/000/005/003/015 D210/D304

Some theorems

 $p(z, \zeta) = \frac{p(z, \zeta)}{|z - \zeta|!} \quad (0 \le \rho \le 2) \text{ where } p(z, \zeta) \text{ satisfies Helder's conditions with respect to z and <math>\zeta$ in G. $a_1(z)$ has canonical form $a_1(z) = \begin{pmatrix} a(1)(z) & a(2)(z) \\ a(2)(z) & a(1)(z) \end{pmatrix} \quad (9) \quad \text{and all the eigen-values } \lambda(z) \quad \text{of the matrix } a(1)_{\{z\}+1} = a^{\{2\}}(z)$ lie in the upper λ - half-plane. K_1 is a linear space of column-vectors defined and continuous in $D + \Gamma$, which have first-order continuous derivatives in D and satisfy helder's condition on Γ . $R_1 = R_2 = R_1 = R_2 = R_2 = R_1 = R_2 = R_1 = R_2 = R_1 = R_2 = R_2 = R_1 = R_2 = R_2 = R_2 = R_1 = R_2 = R_2 = R_2 = R_2 = R_2 = R_1 = R_2 = R_2$

Card 4/7

Some theorem...

 $\kappa_{A_0} = \frac{1}{\pi} \{ \text{arg det } (b_1 + ib_2) \}_r + r + \beta_B,$

 $\times_{B_0} = \frac{1}{\pi} \left[\text{arg det } (b_1 + lb_2) \right]_{\Gamma} + r + \beta_{A'}$

S/02**1/40/000/005**/003/015 D210/D304

- (12) where Landenotes the increase in the term in
 - duced when z goes round
 once in the direction
 once in whose region

which keeps D on the left. Proof. B denotes the operator whose region of definition is R, which satisfies (10) for q=0. A_1 (B_1) is the part of A ($B^{(1)}$) defined on B_1 (A_1). It follows that A_1 has finite d-characteristic and that

 $\mathcal{H}_{A_1} = \frac{1}{\pi} \left[\text{arg det } (b_1 + ib_2) \right]_{\Gamma} + r. \quad (14)$ Also $\beta_B(1) = 0$. Hence from Lemma 1: β_A and the d-characteristic of B_1 are finite and $\mathcal{H}_{B_1} = \mathcal{H}_{A_1} + \beta_A$. (15)

T is the integral operator from Eq. (5) in Vol'pert, A.I. (Ref.4: DAN SSSR, 114, 462 /1957/), transforming from R_2 into β_A . Writing S=B T, S₁ = B₁T, where S

Card 5/7

Some theorem...

S/021/60/000/005/003/015 D210/D304

and S_1 are singular integral operators of normal type. From Lemma 3, B_0 has finite d-characteristic and $\mathcal{H}_S - \mathcal{H}_{S_1} = \mathcal{H}_{B_1} - \mathcal{H}_{B_1}$, taking into consideration that is S and S_1 have only regular components $\mathcal{H}_S = \mathcal{H}_{S_1} + \mathcal{H}_{B_0} = \mathcal{H}_{B_1}$ applying Lemma 1, and simplifying gives the desired results. Theorem 2: There exists a system of linearly independent row vectors V_1 , continuous on Γ , such that for the solution of the equations $B_0 = g$ ($u \in \mathcal{D}_{B_1}$, $g \in R_2$) it is necessary and sufficient that $\int_{D} \mathcal{H}_1 f dx dy = 0 (j=1, \ldots, \mathcal{H}_{A_1})$. Proof: the first part of the theorem follows from $S = B_1 T$ and the known properties of singular integral operators. The second part makes use of lemma 2, making Φ of the form Φ (f) = $\int_{D} \int \widehat{S} f dx dy$, where the $\widehat{\Phi}$ are row-vectors continuous in $D + \Gamma$, and the Φ are of the form Ψ (g) = $\int_{D} \mathcal{V}_1 f dx$, where the Φ are row-vectors continuous in $D + \Gamma$, and the Φ are of the form Φ (g) = $\int_{D} \mathcal{V}_1 f dx$, where the Φ are row-vectors continuous

S/021/60/000/005/003/015

are row-vectors continuous on [. Further, there exists a matrix $\omega(z,\zeta)$ such that for $f\in \mathfrak{H}_{\mathbf{A}}$, the column-vector

$$u(z) = \int_{\mathbf{D}} \int \omega(z,\zeta) f(\zeta) d\zeta d\eta$$

is dependent on R and $u(z) = \int_{D} \omega(z,\zeta) f(\zeta) dz d\eta$ (16) $\text{satisfies Au = f. Then for arbitrary } (j = 1, \dots, \beta B_0)$ there exists a row-vector h, continuous in D + Γ , such that

$$\int_{\mathbf{r}} v_I B u \, ds = \int_{D} h_I A u \, dx \, dy.$$

This holds for all u R, and (17) the normal solution of A follows from lemma 2. There

are 4 Soviet-bloc references.

b complex number, $\frac{9}{30}$ derivative with respect to the normal of S in the point y; B(y) (k = 0, 1, 2, 3) complex quadratic p × p matrices; f(y)

The author investigates the index problem posed by J. M. Gel'fand (Ref.1). It is shown that the index of (I) in general is different from zero and can attain arbitrary even values. An explicit formula for the calculation of the index is given. The problem of the homotopic classification (Ref. 2) of elliptic systems of equations closely connected with the index problem is simultaneously treated. The homotopic classification with problem I. The author gives necessary and sufficient conditions that two elliptic systems of this kind belong to the same homotopic class. The author montions 7 Years.

The author mentions Z. Ya. Shapiro and Ya. B. Lopatinskiy.
